

## # 5 - Narrative:

We plan to replace our existing deck and stair case with Trex composite decking. We will need to dig 10 twelve inch Sonotube holes for the supports. There will be no fill needed for these holes.

On a non-rainy day we plan to drill the 10 holes and then upon inspection fill. Holes will be covered until inspection. Haybales will be placed in front of proposed Sonotube holes. Our plan is to begin and complete the entire project within a 3 week period if possible. We plan to use silt fencing and or hay along the property for containment and stabilization.

We also plan to plant a 5-10 foot buffer zone of native perennials/shrubs after deck has been completed. No vegetation will be removed to dig the Sonotube holes.
